Industrial Networking & Data

High speed communications have become a more prevalent and integral part of the industrial environment. However the skillset required to implement this technology has not kept pace with its rate of introduction or scale of acceptance. Eastern Electric is both knowledgeable and experienced in conceptual design, implementation, operation and maintenance.

The Network Design and Engineering services offered by Eastern Technical Services provides robust, state of the art IP systems for industrial environments. We provide the technical resources and expertise required to design and build networks that meet the highest level of quality and industry standards, all while keeping a keen eye on project costs providing value to you, our customer.

Our team is dedicated to excellence in everything we do, from simple copper and fiber-optic terminations, to network diagnostics and testing, or even an entire network design. Our team can work from your operational specification or write one for you. Custom Network Design, VPN Remote Access, Wireless Networking, System Support, and Troubleshooting, are just a few of the services that we offer.

Our network design experience exceeds the traditional bounds of industrial communications and business class networks with designs that can deliver mission critical data from the plant floor to executive decision makers whether they are nearby or half way around the world.
